Apollo Configuration Guide

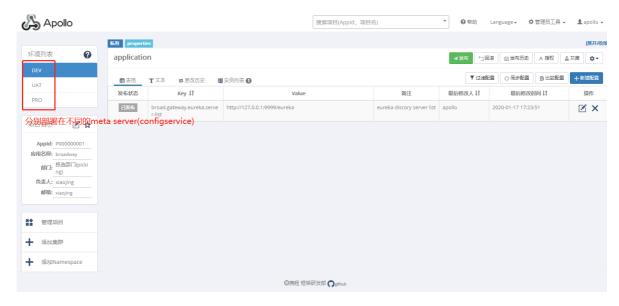

目前市面上流行的三大配置中心框架: <u>Spring CLoud Config</u>、<u>Alibaba Nacos</u> 以及<u>携程apollo</u>, 我们相应架构组号召,就使用Apollo吧。

Work Flow

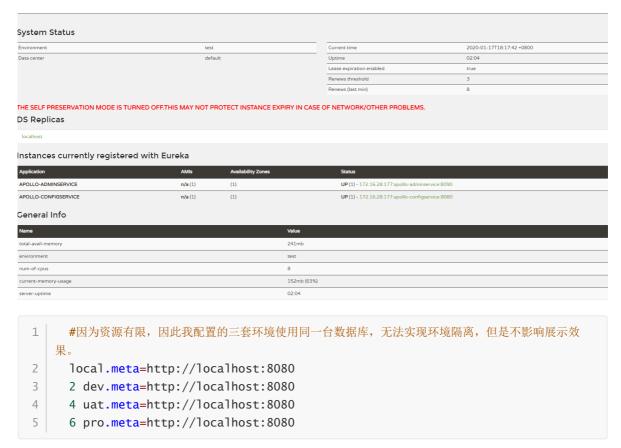

简单解释:

上图中有三套环境 FAT 、 UAT 和 PROD ,每一套环境都部署了2套 Configservice 和 Adminservice . 使用统一的 Portal Server Cluster 对所有环境进行配置管理。如我们自己的配置环境:

Meta-Server (Configservice) 说白一点,就是 Eureka discovery,每一套环境对应不同的一套meta server,以此来实现环境隔离,如下图:

如图2所示。

Configure Server

apollo 服务端主要有三个Spring Boot项目 和两个数据库组成:

- apollo-configservice (默认端口: 8080)
 - 提供配置的读取、推送等功能,服务对象是Apollo客户端
- apollo-adminservice (默认端口: 8090)
 - 提供配置的修改、发布等功能,服务对象是Apollo Portal (管理界面)
- apollo-portal (默认端口: 8070)

通过域名访问Meta Server获取Admin Service服务列表(IP+Port),而后直接通过IP+Port 访问服务,同时在Portal侧会做load balance、错误重试

- apolloportaldb
- apolloconfigdb

因为Apollo官方文档足够详细,想要了解的同学直接Apollo官网传送门

但是又因为官方文档太过详细,以至于如果只想部署的同学可能觉得稍显繁琐,因此,我这里直接开始部署服务端,就废话少说了。

- 1. 第一步,下载https://github.com/ctripcorp/apollo/releases
- 2. 第二步,下载 adminservice 、 configservice 和 portal 三个zip包之后,上传到服务器。
- 3. 第三部,在服务器中安装mysql,并创建数据库,<u>脚本传送门</u>
- 4. 第四步,分别配置三个Springboot服务并启动,主要配置点有3处:
 - 1. 数据库配置

2. 日志路径

■ (/根路径/apollo-xxxx.conf)

/script/startup.sh

```
1 #!/bin/bash
2 SERVICE_NAME=apollo-portal
3 ## Adjust log dir if necessary
4 #这里
5 4 LOG_DIR=/home/jing/software/apollo-portal-
1.5.1/logs/100003173
6 5 ## Adjust server port if necessary
7 6 SERVER_PORT=${SERVER_PORT:=8070}
```

3. 配置apollo-portal的meta service信息

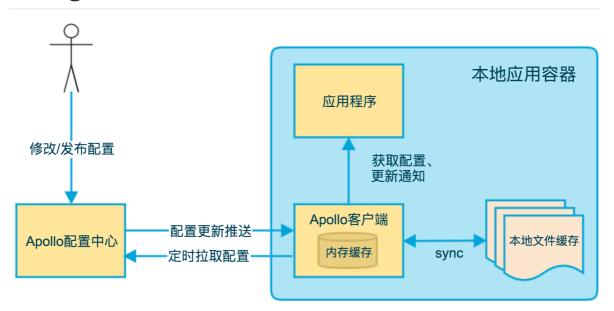

```
local.meta=http://localhost:8080
dev.meta=http://localhost:8080
uat.meta=http://localhost:8080
pro.meta=http://localhost:8080
```

这里也得修改 apolloconfigdb数据库中的表serverconfig 中 apollo.portal.envs 的配置为: dev,uat,prod

```
jing@sysdep:~/software/apollo-adminservice-1.5.1$ ps -ef|grep apollo
jing

```

Configure Client

客户端使用分步骤:访问 (http://172.16.28.177:8070/)

1. 第一步: 创建项目

具体查看使用指南传送门

★ 添加Namespace

上面不是我要说的重点,重点是如何在我们项目中使用,以broadway-gateway为例。

• 第一步: 创建bootstrap.yml, 在application.yml加载之前要加载配置属性

```
1app:2#重点关联,id必须是唯一的,每个service各自不同3id: P00000000014apollo:5meta: http://172.16.28.177:8080/ # apollo-configservice6bootstrap:7enabled: true8namespaces: application
```

• 第二步: 使用配置的变量

```
      1
      eureka:

      2
      instance:

      3
      prefer-ip-address: true

      4
      client:

      5
      service-url:

      6
      # 冒号后面的baidu.com是默认值,如果无法连接apollo,可以使用默认值防止出错

      7
      defaultzone: ${broad.gateway.eureka.server-list:http://baidu.com}
```

运行gateway,可以看到如下结果:

```
2020-01-17 17:06:56.623 INFO 12444 --- [ main]
c.c.f.f.i.p.DefaultApplicationProvider : App ID is set to P000000001 by
app.id property from System Property

======|_|======|__/=/_/_/
:: Spring Boot :: (v2.1.10.RELEASE)
```

可以看到,在springboot启动之前,apollo首先加载配置信息了~

相关profile信息,后续再表,先改bug了~~
